

# Parts Management Flows

<https://www.figma.com/board/kRrIjWUXdow6bg7KBHkx7/Parts-Management-Flows?t=OLIEqNQBjsespMKG-6>

## Overview

This page documents the user flows and systems mapping for parts management across all SSOT Project use cases. Each flow includes a Current State and Future State section. Current state will be mapped first through working sessions; future state will be defined once current state is validated.

## Use Cases

| #  | Vendor            | Use Case                                       | Integration Type        | Job Types                 | Notes                                                            |
|----|-------------------|------------------------------------------------|-------------------------|---------------------------|------------------------------------------------------------------|
| 1  | 3rd Party Network | Asurion Owned Parts (AOP)                      | ServiceBench + DAX      | Remote Tech only          |                                                                  |
| 2A | 3rd Party Network | Non-Asurion Owned Parts — Mobile Clinic (NAOP) | RTI Webservice          | Depot, Carry-In           |                                                                  |
| 2B | 3rd Party Network | Non-Asurion Owned Parts — Mexico (NAOP)        | RTI Webservice          | Depot, Carry-In           |                                                                  |
| 3  | Asurion/UBIF      | UBIF Legacy Stores                             | JSON Feed               | RT, Depot, Carry-In       | No need to map since legacy is migrating to New Gen by end of Q3 |
| 4  | Asurion/UBIF      | UBIF Next Gen Stores                           | JSON Feed               | RT, Depot, Carry-In       |                                                                  |
| 5  | All               | Repair Asset & BOM Setup                       | DAX, ServiceBench, UBIF | N/A — Setup/Configuration |                                                                  |

### ▼ Flow 1 — Asurion Owned Parts (AOP)

**Scope:** 9 stores, Remote Tech only

**Systems in play:** ServiceBench, DAX

#### Current State

**Swim Lane Actors:** User → ServiceBench → DAX

### What to capture

- Current parts management journey, end-to-end
- Screenshots from ServiceBench at each step
- DAX connections and functions shown as system-to-system interactions in the swim lane
- Parts ordering, transfer orders, shipment tracking, cycle counts

 **Working session needed:** Walk through with Amir + Raghu. Request ServiceBench screenshots for each step.

### Future State

 Coming soon — to be defined after current state is validated and architecture is finalized

## ▼ Flow 2 — Non-Asurion Owned Parts (NAOP)

These two sub-flows share the same journey structure. They can be mapped in one diagram with parallel swim lane columns per provider system.

### Flow 2A — Mobile Klinik (RTI Webservice)

**Job types:** Depot, Carry-In (no Remote Tech)

**Integration:** RTI Webservice → ServiceBench

### Current State

**Swim Lane Actors:** Mobile Klinik System → RTI Webservice → ServiceBench

### What to capture

- How Mobile Klinik's system integrates via RTI webservice to send inventory feed to ServiceBench
- How jobs are downloaded and updated via API
- How inventory is decremented/incremented post-job
- Systems mapping of current state

 **Working session needed:** Walk through with Amir + Raghu.

### Future State

 Coming soon — to be defined after current state is validated and architecture is finalized

### Flow 2B — Mexico (RTI Webservice)

**Job types:** Depot, Carry-In (no Remote Tech)

**Integration:** RTI Webservice → ServiceBench

## Current State

**Swim Lane Actors:** Mexico System → RTI Webservice → ServiceBench

### What to capture

- Same RTI webservice integration pattern as Mobile Klinik
- Capture any system-level differences in the swim lane
- Systems mapping of current state

 **Working session needed:** Walk through with Amir + Raghu.

---

## Future State

 Coming soon — to be defined after current state is validated and architecture is finalized

---

## ▼ Flow 3 — UBIF Next Gen Stores (JSON Feeds)

**Integration:** JSON Feed (store-level inventory)

**Job types:** Remote Tech (RT), Depot, Carry-In (CI)

## Current State

**Swim Lane Actors:** UBIF Next Gen System → JSON Feed → ServiceBench

### What to capture

- Same structure as Flow 3
- Capture any system or UI differences between Legacy and Next Gen in the swim lane
- Systems mapping of how parts are managed today

### Sub-flows

- **4A** — Remote Tech (RT)
- **4B** — Depot
- **4C** — Carry-In (CI)

 **Working session needed:** Walk through with Amir, Raghu + UBIF SMEs.

---

## Future State

 Coming soon — to be defined after current state is validated and architecture is finalized

---

## ▼ Flow 4 — Repair Asset & BOM Setup

**Scope:** Initial setup of repair assets and Bill of Materials (BOM) across systems

**Systems in play:** DAX, ServiceBench, UBIF

**Stakeholders:** MDM (Master Data Management), Robbie Carter (Field Inventory Service Manager)

---

### Current State

**Swim Lane Actors:** DAX → ServiceBench → UBIF

#### What to capture

- How repair assets are initially set up in DAX
- What setups are required in ServiceBench and UBIF as downstream systems
- How BOM is configured and how that data flows across DAX, ServiceBench, and UBIF
- MDM's role in managing and governing the asset and BOM data
- Any manual steps or gaps in the current setup process

 **Working session needed:** Walk through with MDM team + Robbie Carter (Field Inventory Service Manager).

---

### Future State

 Coming soon — to be defined after current state is validated

---

## ▼ ~~Flow 5 — UBIF Legacy Stores (JSON Feeds)~~

**Integration:** JSON Feed (store-level inventory) - **Migrating over to Next Gen by Q3**

**Job types:** Remote Tech (RT), Depot, Carry-In (CI)

---

### Current State

**Swim Lane Actors:** UBIF Legacy System → JSON Feed → ServiceBench

#### What to capture

- How JSON inventory feed is sent to ServiceBench at the store level
- How inventory is applied across all three fulfillment types
- User flow variations per job type (inventory logic is the same; user experience differs)
- Systems mapping of how parts are managed today

#### Sub-flows

- **3A** — Remote Tech (RT)

- **3B** — Depot
- **3C** — Carry-In (CI)

**Working session needed:** Walk through with Amir, Raghu + UBIF SMEs.

## Future State

Coming soon — to be defined after current state is validated and architecture is finalized

## Working Sessions Plan

| Session   | Focus                                                     | Attendees               | Format           |
|-----------|-----------------------------------------------------------|-------------------------|------------------|
| Session 1 | Flow 1 — AOP Current State                                | Amir, Raghu, Michelle   | FigJam swim lane |
| Session 2 | Flows 2A, 2B — NAOP Current State (Mobile Klinik, Mexico) | Amir, Raghu, Michelle   | FigJam swim lane |
| Session 3 | Flows 3 & 4 — UBIF Legacy + Next Gen Current State        | Amir, Raghu + UBIF SMEs | FigJam swim lane |
| Session 4 | Flow 5 — Repair Asset & BOM Setup Current State           | MDM Team, Robbie Carter | FigJam swim lane |

Sessions will be recorded. DAX team does not need to attend current-state sessions — they can review recordings asynchronously.

## Notes

- Future state direction: DAX builds inventory screens exposed via MFE/micro-app embedded in Prism; real-time API availability calls replace inventory feeds
- UBIF Distro → DAX migration is a parallel workstream owned by DAX/UBIF — not in scope for current state mapping
