

APC-2299 Project Brief

**** COPY this page and replace the title and text with your answers. Once complete, provide the link to your new page in your APC ticket.**

Requester Information

- **Author Name:** Bryant Mayne
- **Role/Title:** Sr. Director, Software Engineering
- **Department/Team:** DAX 1548 - Supply Chain Technology
- **Technology Request Link (If exist already)**

Request Description

- **What is the high-level scope of this request:** *What needs to be done? ex: something needs to be modified, installed, disabled, etc*
 - SUR Related inventory functions need to be migrated from the ServiceBench platform to the D365 F&O platform, similar to what was done for DES/NDES. This is both inventory feeds for Non-Asurion owned parts as well as inventory management for Asurion owned parts.
- **Problem Statement:** *What problem or challenge is this initiative solving? Why is it important to address this now?*
 - Architectural simplification to reduce the number of inventory systems providing better inventory fidelity and tracking. Additionally, reduction of scope of the PRISM platform.
- **Business Context & Alignment:** *How does this request tie into team, department, or company goals or KPIs? Is it part of a larger project or roadmap?*
 - This effort is a key Initiative in the Fulfillment domain's 2026 Annual Plan Objective 2: Create a unified fulfillment ecosystem with a single, accurate system of record for inventory.
- **Objective / What You Want to Achieve:** *Describe in a few clear sentences what you want to accomplish. Focus on what success looks like.*

Success looks like:

- A unified system of record for inventory across all locations. (stores, field, FSLs)
- A single source system for all field inventory, including full visibility into third-party parts.

- A single source system for all store inventory, fully integrated with the financial system of record.
 - End-to-end chain-of-custody tracking, with every movement, from warehouse receipt to field, store, and customer, systematically recorded and traceable.
 - Standardized enterprise warehouse management and inventory controls, including consistent adjustments, audits, cycle counts, and reconciliations across all sites.
 - Measurable reduction in inventory shrinkage due to strengthened controls, visibility, and tracking.
 - **Scope of Work (What We Are Building/Changing):** *Describe the key components or capabilities involved. If unsure, provide high-level guidance.*
 -  [SUR - SSOT - Inventory Availability Orchestration](#)
 - Asurion owned parts (AOP): 3rd Party inventory management will have to be moved from ServiceBench to F&O stack. Initially via Warehouse Mobile App which is a native mobile application experience. Eventually this could potentially be exposed as APIs and thus embedded in ServiceBench to prevent swivel chair between two applications.
 - Non-Asurion owned parts (NAOP): Redirect 3rd party inventory feeds from Service Bench to the F&O technology stack (likely Inventory Visibility Service). Service Bench to call Inventory availability endpoint for inventory check similar to DES/NDES.
 - UBIF Legacy Stores: Redirect inventory feeds from Service Bench to the F&O technology stack (likely Inventory Visibility Service). Service Bench to call Inventory availability endpoint for inventory check similar to DES/NDES.
 - UBIF Next Gen Stores: Stop sending inventory feeds from UBIF F&O to ServiceBench but rather have ServiceBench call DAX Inventory Availability Service similar to DES/NDES.
 - **Current Process / Workaround (for automation or tooling requests):** *What is the current process, tool, or workaround being used? Where are the inefficiencies or gaps?*
 - See above. Currently 3rd Party Repairs using AOP use the ServiceBench mobile app to manage inventory.
 - **Is there a cost associated with this request? How much?**
 - Estimated cost \$50,000-\$100,000 in Technology Labor to support
 - **Is this request linked to any external vendors, tools, or compliance obligations?**
 - Small impact to CAN and LatAm 3rd party repairers that may potentially need to repoint their feeds.
-

Success Metrics

- How do we know if we've solved this problem? What does success look like? Include quant and qual metrics as appropriate.
 - All inventory functions for SUR have been removed from ServiceBench and align to DES/NDES pattern.
 - All inventory inquiries and reservations should be handled by D365.
 - All inventory management of AOP should be handled by D365.
 - The above should provide end to end traceability of parts and drive down inventory shrink \$250k YoY.
-

Timeline

- What is the proposed go-live date and what are the milestones? If the proposed go-live date is within the coming quarter, provide details as to why this should be prioritized ahead of initiatives in-flight?
 - Q1: Migrate UBIF inventory queries to D365
 - Q2: Migrate 3rd Party Repair NAOP inventory feeds to D365
 - Q3: Migrate 3rd Party AOP inventory management to D365
-

Constraints

- What are the key constraints, deadlines, or hard requirements to consider?
-

Additional

- Add any assertional information that will help understand the request better
